Ans-1

SQL Injections :-

→ It is a vulnerability in which an attacker attempts to use application code to access or corrupt database content, this allows the attackers to create, read, update, insert, alter or delete data stored in the back-end database.

Cross site scripting :-

→ It targets an application's user by injecting code, usually a client side script such as JavaScript, into a web application output.

Broken Authentication

It encompasses several security issues, all of them having to do with maintaining the identity of a user.

Insecure Direct Object Reference :-

When a web application exposes a reference to an internal implementation object. Internal implementation objects include files, database records can be manipulated to gain access to a user's personal data.

Security Misconfiguration :-

Security misconfiguration encompasses several types of vulnerabilities all centered on a lack of maintenance or a lack of attention to the web app configuration. Security misconfiguration gives hackers access to private data or features & can result in a complete system compromise.
